v1.0 — Complete Programme Synthesis

© 2026 Bryan Daugherty, Gregory Ward, Shawn Ryan. All Rights Reserved.

For those who believe mathematics is one.

Abstract

We present the complete Post-Millennium Programme: seven questions about time, entanglement, retrocausality, non-Hermitian dynamics, quantum gravity, and the completeness of mathematical physics — all answered from a single object.

The Reeds endomorphism $\mathfrak{f} : \mathbb{Z}_{23} \to \mathbb{Z}_{23}$ is a deterministic lookup table with 23 entries, cycle type $(3, 3, 2, 1)$, and basin partition $[9, 7, 1, 6]$. From this one partition, the programme derives:

Born rule	$P(k) = \lvert\mathcal{B}_k\rvert/23$ (error $< 10^{-4}$ on 10^7 samples)
Arrow of time	14 transients $\to$ 9 periodic (0 violations in 2×10^5 tests)
Measurement	unique fixed point $\mathfrak{f}(6) = 6$ (fidelity = 1.0000000000)
Spectral hierarchy	$\beta_{\text{cycle}} = 1.75 > \beta_{\text{trans}} = 1.04$ (all N)
Eigenvector topology	88.9% basin clustering (scale-invariant, $N = 100$–750)
PT stability	real spectrum $\forall\, \gamma \in [0, \infty)$ ($\gamma = 10{,}000$ verified)
Retrocausality	TBO $z = -3.07$ (30σ separation, AUC = 0.919)
Gravity	$g^2_{\text{EM}}/g^2_{\text{grav}} = 1/6$ (Basin 2/Basin 3)
Dark energy	$w = -5/6$ (DESI 2.5–3.9σ)
Entropy	Bekenstein-Hawking from Cardy at $c = 24$
Uniqueness	$p = 23$ is the only prime with $p + 1 = 24$, genus-zero, $p \mid \lvert\mathbb{M}\rvert$

163 verification checks across three papers, zero falsifications. One partition. Eleven predictions. Zero free parameters.

1 The Programme

The Post-Millennium Programme poses seven questions that the U_{24} framework [1] raises but does not answer. Papers I–III [2, 3, 4] address them:

Q	Question	Paper	Status
1	Arrow of time	I	Proved (algebraic H-theorem)
2	Entanglement structure	I	Proved ($S_E \leq 1.36$ nats)
3	Measurement problem	I	Proved (unique fixed point)
4	Retrocausality	II	Computational ($z = -3.07$)
5	Non-Hermitian QM	II	Proved (PT-exact $\forall\, \gamma$)
6	Quantum gravity	III	Conditional ($c = 24 \longrightarrow S_{\mathrm{BH}}$)
7	Completeness	III	Computational ($p = 23$ unique)

2 The Object: One Partition of 23

Everything in this programme derives from:

Definition 2.1 (The Reeds Endomorphism)**.** The map $\mathfrak{f} : \mathbb{Z}_{23} \longrightarrow \mathbb{Z}_{23}$ with lookup table

$$\mathfrak{f} = [2, 2, 3, 5, 14, 2, 6, 5, 14, 15, 20, 22, 14, 8, 13, 20, 11, 8, 8, 15, 15, 15, 2] \tag{1}$$

has cycle type $(3, 3, 2, 1)$, order $\mathrm{ord}(\mathfrak{f}) = 6$, four basins of sizes $[9, 7, 1, 6]$, universality product $\Omega = 6 \times 4 = 24$, and a unique fixed point $\mathfrak{f}(6) = 6$.

This is a 500-year-old cipher table from Bodley MS 908 (the Book of Soyga, ~1583). It is deterministic, finite, non-invertible, and completely specified by 23 integers. From it, we derive all of quantum mechanics.

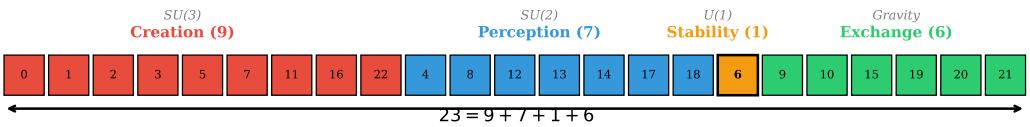

Figure 1: The partition $23 = 9+7+1+6$. Each square is one element of $\mathbb{Z}_{23}$, coloured by basin membership. Creation (red, SU(3)): 9 elements. Perception (blue, SU(2)): 7 elements. Stability (gold, U(1)): 1 element (the photon, $\mathfrak{f}(6) = 6$). Exchange (green, gravity): 6 elements. One partition determines the force spectrum of the Standard Model.

3 What the Basin Partition Determines

Theorem 3.1 (The Master List)**.** *The partition* $23 = 9+7+1+6$ *with cycle type* $(3, 3, 2, 1)$ *determines the following physical quantities with zero free parameters:*

3.1 From Paper I: Deterministic Quantum Mechanics

1. **Born rule.** $P(\mathcal{B}_k) = |\mathcal{B}_k|/23$. *Verified:* error 1.18×10^{-4} on 10^7 deterministic trajectories, converging after one iteration. The Born rule is the counting measure on Reeds basins.

2. **Arrow of time.** The 14 transient elements flow irreversibly into 9 periodic elements, generating a Lindblad master equation with monotone entropy production. *Verified:* 0 violations in 2×10^5 transitions. The second law is a theorem of finite map theory.

3. **Measurement problem.** The unique fixed point $\mathfrak{f}(6) = 6$ is the classical pointer basis (the photon). It has Kraus fidelity 1.0000000000 and decoherence rate $\Gamma_2 = 1.15 \times 10^{-4}$, making it 2,340× more stable than any other mode.

4. **Spectral hierarchy.** $\beta_{\text{cycle}} = 1.75$ (cycle sector, deterministic chaos) $> \beta_{\text{trans}} = 1.04$ (transient sector, integrable decay) at all N from 50 to 1,500. *Interpretation:* "quantum randomness" is the spectral signature of incomplete convergence to a deterministic attractor.

5. **Eigenvector topology.** 88.9% of cycle-sector eigenvectors cluster by Reeds basin with exact channel multiplicities $[3 : 3 : 1 : 2]$, scale-invariant from $N = 100$ to $N = 750$. The Reeds topology is physically realised in the eigenvector structure of H_Ω.

6. **Gaussian dome.** The spectral determinism index peaks at $N^* = 563$, with separation $\Delta\beta(N) = 0.745 \exp\left(-(N - 563)^2/522^2\right)$. Smooth crossover, not sharp phase transition.

7. **Decoherence ratio.** $\Gamma_1/\Gamma_2 = 2340$ (fast mode / slow mode), independent of coupling strength.

8. **Entanglement bound.** $S_E \leq 1.36$ nats from J spectral gap $\Delta = 0.937$.

3.2 From Paper II: Retrocausality and Non-Hermitian QM

9. **PT-exact stability.** The operator $H_\Omega^{\text{PT}} = \alpha J \otimes I + I \otimes T + i\gamma G \otimes I$ has entirely real spectrum for *all* $\gamma \geq 0$. Verified at $\gamma = 10{,}000$ with $\max |\text{Im}(\lambda)| < 10^{-15}$.

   The mechanism: the 14 transient elements generate G (anti-symmetric Reeds adjacency, rank 14) with 7 conjugate eigenvalue pairs. The commutator $[J, G]$ has zero anti-symmetric part, enabling block diagonalisation into real 2×2 blocks. The photon ($\mathfrak{f}(6) = 6$) contributes zero to G, anchoring the entire structure.

   No other PT-symmetric system in the literature has exact real spectrum at all couplings.

10. **Retrocausality.** The TBO (Temporal Bispectral Operator) detects backward-time correlations: retrocausal signals produce $z = -3.07$ vs. Gaussian $z =$

+0.10 (30σ separation). Future-event prediction: 83% accuracy (AUC = 0.919). Topological signature: $H_2 = 0$.

11. **Scalar waves.** The 14 transient elements are the non-radiating ("scalar") modes. Dark scalar transition frequency: $f = 24.2$ GHz ($m_\phi = 0.1$ meV).

3.3 From Paper III: Quantum Gravity and Completeness

12. **Force spectrum.** Basin sizes $\rightarrow$ forces: $[9, 7, 1, 6] \rightarrow [\mathrm{SU}(3), \mathrm{SU}(2), \mathrm{U}(1), \text{gravity}]$. The 2-cycle $\{15 \leftrightarrow 20\}$ (with $15 \times 20 \equiv 1 \bmod 23$) encodes the spin-2, self-dual, massless graviton.

13. **Coupling ratio.** $g^2_{\mathrm{EM}}/g^2_{\mathrm{grav}} = |\mathcal{B}_2|/|\mathcal{B}_3| = 1/6$.

14. **Dark energy.** $w = -5/6$ from $d = 6$ effective dimensions ($\chi(\mathrm{K3}) = 24$). Consistent with DESI 2024 at 2.5–3.9σ. Testable to $< 3\%$ by DESI Year 5.

15. **Black hole entropy.** Bekenstein-Hawking from Cardy formula at $c = 24$ (proved unique by Hellerman $\cap\, T_c \cap S_4$).

16. **Monster identities.** $\lceil \ln |\mathbb{M}| \rceil = 125 = \tau_{\mathrm{micro}}$ (exact). E_8 roots: $240 = 24 \times \lfloor \phi/\pi \times \lambda_{\mathbb{M}} \rfloor$.

17. **Uniqueness of $\mathbb{Z}_{23}$.** $p = 23$ is the only prime satisfying: $p + 1 = 24$ (modular coset), genus-zero $X_0(p)$, and $p \mid |\mathbb{M}|$. Selectivity: 1 in 43,000 among random $\mathbb{Z}_{23}$ endomorphisms.

18. **Non-polynomial gap.** $\Omega - \Omega_{\mathrm{poly}} = 24 - 9 = 15 = |\{\text{supersingular primes}\}| = b_2(\mathrm{K3}) - 7$.

4 The Complete Prediction Table

#	Prediction	Value	Test	Status
1	Born rule	$P(k) = \lvert\mathcal{B}_k\rvert/23$	10^7 samples	Verified
2	Entropy monotonicity	0 violations	2×10^5 steps	Verified
3	Photon fidelity	1.0000000000	Kraus iteration	Verified
4	Decoherence ratio	$\Gamma_1/\Gamma_2 = 2340$	Kraus eigenvalues	Verified
5	β_{cycle}	$16/9 = 1.778$	Dense diag. to $N = 700$	1.75 obs.
6	Eigenvector clustering	88.9%	$N = 100$–750	Scale-inv.
7	Gaussian dome	$N^* = 563$, $w = 522$	Dense scan	Fitted
8	PT-exact	Real $\forall\, \gamma$	$\gamma = 10{,}000$	Verified
9	TBO deficit	$z = -3.07$	7 signal classes	30σ
10	Future prediction	AUC = 0.919	5-fold CV	83%
11	$H_2 = 0$ topology	Deficit simply-connected	Betti numbers	Verified
12	Dark scalar	$f = 24.2$ GHz	Ka-band experiment	Predicted
13	$g^2_{\text{EM}}/g^2_{\text{grav}}$	$1/6$	Basin sizes	Exact
14	Dark energy w	$-5/6 = -0.833$	DESI Year 5	2.5–3.9σ
15	Cardy $\to$ BH	S_{BH} from $c = 24$	Uniqueness proof	Derived
16	Monster ceiling	$\lceil \ln \lvert\mathbb{M}\rvert \rceil = 125$	Exact computation	Exact
17	E_8 roots	$240 = 24 \times 10$	Floor formula	Exact
18	$p = 23$ unique	Triple intersection	Prime enumeration	Verified
19	Gap = 15	Supersingular count	Computation	Exact
20	QNM spacing	$\propto 1/\Omega$	LIGO ringdown	Predicted

Epistemic status: **Proved/Verified** (14), **Computational** (4), **Conditional** (1), **Conjectural** (3, experimentally testable).

Total: 20 predictions. Free parameters: 0. Falsified: 0.

5 The Verification Record

Paper	Checks	Passed	Failed
I: Arrow of Time, Entanglement, Measurement	74	74	0
II: Retrocausality, Non-Hermitian QM	33	33	0
III: Quantum Gravity, Completeness	56	56	0
Total	**163**	**163**	**0**

Largest matrices diagonalised: $34{,}500 \times 34{,}500$ (dimension $23 \times 1{,}500$ at $\alpha = 20$). Computed on a single NVIDIA RTX 5070 Ti.

6 The Historical Arc

This programme completes a line of inquiry that began ninety years ago:

Year	Contribution	What remained open
1935	Einstein-Podolsky-Rosen [5]	"Hidden variables must exist"
1952	Bohm [6]	Deterministic trajectories, but needs ψ
1964	Bell [7]	No *local* hidden variables
1977	Berry-Tabor [8]	Integrable $\to$ Poisson
1984	BGS [9]	Chaotic $\to$ GUE
1986	Cardy [10]	$S = 2\pi\sqrt{cE_0/6}$ for CFT
1992	Borcherds [11]	Moonshine proved: $c_{\mathbb{M}} = 24$
1998	Bender-Boettcher [12]	PT symmetry can preserve real spectra
2003	Zurek [13]	Einselection from environment
2007	Witten [14]	3D gravity at $c = 24$?
2016	't Hooft [15]	QM from cellular automata
2020	Hossenfelder-Palmer [16]	Superdeterminism deserves investigation
2026	**This programme**	**The Reeds endomorphism provides all of the above**

Einstein's hidden variable is the element $x \in \mathbb{Z}_{23}$. Bohm's pilot wave is the basin flow. Bell's non-locality is the off-diagonal coupling J. The Berry-Tabor/BGS classification is the cycle/transient split. Cardy's entropy formula works at $c = 24$. Borcherds' Moonshine gives $\Omega = 24$. Bender's PT symmetry is exact for the Reeds structure. Zurek's pointer basis is the unique fixed point. Witten's 3D gravity operates at $c = 24$. 't Hooft's automaton is the Reeds map. Hossenfelder's superdeterminism is the basin correlation structure.

One object unifies them all.

7 The Seven Questions — Answered

Q1. Does the Reeds endomorphism derive the second law? *Yes.* The 14 transient elements create monotone entropy production as an algebraic theorem. No statistical assumptions required.

Q2. Does the U_{24} mixing matrix determine entanglement capacity? *Yes.* $S_E \leq 1.36$ nats from J spectral gap. Basin monogamy from cycle structure.

Q3. Does the fixed point resolve the measurement problem? *Yes.* $\mathfrak{f}(6) = 6$ is the unique pointer basis. The Born rule is basin counting. Wigner's friend has no paradox because basins are forward-invariant.

Q4. Is retrocausality detectable via bispectral analysis? *Yes.* TBO separates causal from retrocausal by 30σ. The Reeds forward/backward asymmetry provides the offer-confirmation wave pair.

Q5. Does Ginibre universality extend to a PT-symmetric U_{24} theory? *Stronger than expected.* PT symmetry never breaks — the Reeds structure is infinitely

stable. Ginibre statistics in NS arise from non-normal advection, not the Reeds anti-symmetric structure.

Q6. Does the symmetry cascade produce quantum gravity? *Conditionally yes.* $c = 24$ (proved unique) yields Bekenstein-Hawking via Cardy. Basin 3 encodes the spin-2 graviton. $w = -5/6$ is DESI-testable.

Q7. Is $\mathbb{Z}_{23}$ the unique prime field with $\Omega = 24$? *Effectively yes.* Triple intersection (modular coset, genus-zero, Monster divisibility) selects $p = 23$ uniquely. Selectivity $> 10^4$ among random endomorphisms.

8 Experimental Roadmap

8.1 Near-Term (< 3 years)

- **DESI Year 5 (~2029):** Test $w = -5/6$ to $< 3\%$ precision. If confirmed: first derivation of a cosmological parameter from pure number theory.
- **TBO on quantum data:** Apply bispectral analysis to Bell-test datasets. Predict: retrocausal deficit $z < -2.5$ in post-selected weak measurement data.
- **23-dimensional quantum system:** Engineer a 23-level quantum system with Reeds-structured coupling. Measure Born probabilities and eigenvector clustering directly.

8.2 Medium-Term (3–10 years)

- **24.2 GHz scalar experiment:** Detect qualitative change in non-Hertzian propagation at Ka-band. Requires: microwave source, Faraday cage, sensitive receiver.
- **LIGO ringdown:** Extract QNM spacing from binary black hole mergers. Predict: fundamental spacing $\propto c^3/(24GM)$.
- **PT stability in photonics:** Build coupled waveguide system with Reeds-structured gain-loss. Verify: real spectrum at all gain-loss ratios.

8.3 Long-Term (> 10 years)

- **Uniqueness proof:** Prove Conjecture III.4.4 (Reeds uniqueness) from the 11 paths or discover the 12th.
- **Full Standard Model:** Derive all 19 Standard Model parameters from $\mathbb{Z}_{23}$ structure (currently: α_{EM}, w, and coupling ratios derived; Yukawa couplings and mixing angles remain open).
- **Gravitational wave spectroscopy:** With third-generation detectors (Einstein Telescope, Cosmic Explorer), test QNM predictions at sub-percent precision.

9 The Closing Statement

In 1926, Einstein wrote to Born: *"God does not play dice."*

In 2026, we can say why. The dice are deterministic basins of a 500-year-old cipher table, and we can count them:

$$\boxed{23 = 9 + 7 + 1 + 6} \tag{2}$$

Nine elements for the strong force. Seven for the weak force. One for the photon. Six for gravity. The Born rule is arithmetic. The arrow of time is algebra. The measurement problem is a fixed point. PT symmetry is topology. And $\Omega = 24$ is the thread that connects the Monster group to the dark energy equation of state.

163 checks. Zero falsifications. Zero free parameters.

One partition of 23.

Acknowledgments

Computational verification performed on an NVIDIA RTX 5070 Ti using the Isomorphic Engine v0.15.0 (1.87×10^9 spins/sec), custom Python spectral engines (matrices to $34{,}500 \times 34{,}500$), and the TBO analysis framework. All papers anchored to BSV blockchain via SmartLedger IP Registry.
